This present sequence is that of a peptide antagonist of zonulin (2), one of 25 such peptides (see Y79105-29) of the invention, which bind to a zonula occludens toxin (20T) receptor, yet do not physiologically modulate the opening of mammalian tight junctions (TJ). The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of recombinant DNA techniques. The peptide antagonists are used as an antiinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the ZOT receptor in the intestine and yet does not physiologically modulate the opening of TJ in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for
                                                                                                                                                                                                                                                                                                 New peptide antagonist of zonulin useful as antiinflammatory agent for treating cerebral ischemia, stroke, cerebral edema, gastritis, shigeilosis, viral gastroenteritis, meningitis, encephalomyelitis

It may be responsible for diarrhoea in some strains of cholera and the ZOT gene or fragments of it are deleted from strains of vibrio cholerae (V.c.) to be used as vaccines. These V.c. strains have 100% efficacy in protecting humans against subsequent infection with a strain of a similar serotype and avoid undesirable side effects such as diarrhoea, nausea and cramping. Cultures of these strains may be used for prodn. of vaccines against cholera.

It can be artificially synthesised using recombinant techniques. Partial sequences of the HZP-2 gene were subcloned, the sequences and primers used in cloning and subcloning are given in 092255-69.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9-23kb inserts of DNA from placenta tissue of a male caucasian cloned into the Lambda Fix (RTM)II vector was screened with probes encoding porcine ZPA and ZPB proteins. Positive clones were analysed further by Southern hybridisation using the porcine probes and restriction analysis. Clones encoding human ZPA and ZPB proteins were identified (see 055616 and 055617 respectively).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Use of zona pellucida proteins and reproducible transient infertility female mammals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             09-NOV-1992;

                   This sequence represents a human ZPA protein isolated from zona pellucida. This protein can be used in a method for specifically inducing transient infertility or permanent sterility in a host animal by selective vaccination with specific zona pellucida proteins or immunocontraceptively active fragments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence represents the human zona pellucida ZPA protein. The invention relates to the isolation of novel nucleotide sequences ence zona pellucida proteins from mammalian, especially porcine, lapine, canine, feline, bovine, human or cynomolgus monkey sources. The zona pellucida proteins (ZPA, ZPB, and ZPC) are used in the induction of transient or permanent infertility. At present the method is used in veterinary applications to induce transient or permanent infertility

                                                                                                                                                                                                                                                                                                                                                      immunologically active fragment selected from feline, bovine, cynomologous monkey or human ZPB polypeptides; (2) an isolated, purified recombinant feline, bovine, cynomologous monkey or human ZPB polypeptide or immunologically active fragment; and (3) a fusion protein comprising a ZPB polypeptide which is conjugated with a compound selected from keyhole limpet haemocyanin, muramyl dipeptide, histidine-tag, beta-gal, or palmitic acid where the fusion protein remains effective to stimulate production of antibodies that recognise a ZPB polypeptide. The method is useful for providing transient or permanent infertility or sterility in humans and animals. The present sequence represents human ZPA, which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 administration of homologous and/or heterologous mammalian species zona pellucida (ZP) proteins or immunocontraceptively active fragments. Also described are: (1) a method for inducing transient infertility in mammal by administering directly an antibody directed to a ZPB or an

                                                                                                                                                                                                                                                                                  polynucleotides encoding zona pellucida proteins from other mammalian species. Administration of zona pellucida proteins to a host animal results in a specific immunocontraceptive effect. Administration of purified ZPA and/or ZPB induces transient infertility in females. Fertility can be maintained in an on or off condition in a controllable/predictable fashion. Administration of ZPC induces permanent sterility. Use of a purified zona pellucida protein rather than a complex mixture of zona pellucida proteins reduces the potential for unwanted side-effects which may be harmful.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Zona pellucida; ZPA; ZPB; ZPC; purified; mammalian; glycoprotein; target; immunocontraception; vaccine; antibody; transient; infert controllable; predictable; permanent; sterility; side effect.

The zona pellucida is a complex matrix surrounding the mammalian occyte, formed of glycoproteins secreted by ovarian cells. The previously mentioned ZPA proteins can be used to produce a fusion protein to stimulate production of antibodies in a mammal that recognize a ZPA polyeptide of the mammal. The ZPA polypeptides are useful as vaccines for selectively effecting transient infertility in mammals. ZP has an important role in maintaining the occyte and in occyte-sperm interactions and so is a target for a contraceptive agent which interferes with the fertilization process. Providing a specific polypeptide reduces the need for a complex mixture of many ZP proteins which may create unwanted and harmful side effects. The duration of transient fertility is controllable and can be maintained in a controllable and/or predictable fashion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   09-NOV-1993;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         specifically ZPC proteins. Also described are fusion proteins of ZPC with any of keyhole limpet haemocyanin, muramyl dipeptide, histidine tag, beta-galactosidase or palmitic acid, capable of stimulating mammalian antibodies that recognise mammalian ZPC. Recombinant ZPC proteins are used to immunise animals to induce transient infertility or permanent female sterility, in humans or other mammalis. Z33243 to Z33254, Z33270 to Z33274 and Z33285 encode mammalian ZP proteins given in Y52971 to Y52988 from the present invention. Z33255 to Z33269 and Z33275 to Z33284 represent oligonucleotides used in the exemplification of the present
                                                                                                                    US5955294-A.
                                                                                                                                                                              Nematode extracted anticoagulant protein; NAP; anticoagulant; serine protease inhibitor; NAP domain; factor VIIa/TF.
                                                                                                                                                                                                                          Mature nematode extracted anticoagulant protein AcaNAP47d1.
                                                                                                                                                                                                                                                                                                                    Y30424 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example 11; Column 133-136;

                                                                                                                                                                                                                           The present sequence represents a nematode extracted anticoagulant CC proteal (NAP). The protein has activity as an anticoagulant and/or serine protein (NAP). The protein contains at least one NAP domain which CC protease inhibitor. The protein contains at least one NAP domain which CC has selective inhibitory activity for factor VIIa/TF. The specification CC describes a method for screening an isolated protein at least one domain CC for factor VIIa/TF selective inhibitory activity. The method comprises CC determining the time to clotting effected by a concentration of the CC isolated protein in an ex vivo prothrombin time (PT) assay and an ex vivo CC activated partial thromboplastin time (aPTT) assay; calculating CC prolongation of clotting effected by the isolated protein in each of CC the PT and aPTT parolongation of clotting is calculated as fold CC elevation of clotting time relative to a baseline clotting value, where CC alculating of clotting time is deemed a two-fold elevation; and CC calculating of clotting time is deemed a two-fold elevation; and CC useful to a protein has factor VIIa/TF inhibitory activity. The method is constituted if a protein has factor VIIa/TF inhibitory inhibitory
                                                                           Query Match 53.6

"Nucleotide sequence of the gene encoding the surfaglycoprotein of coronavirus MHV-JHM.";

J. Gen. Virol. 68:47-56(1987).

-I- FUNCTION: THE PEPLOMER PROTEIN MEDIATES THE BII-
TO THE HOST CELL RECEPTOR AND IS INVOLVED IN MAND IN SYNCYTION FORWATION.

-I- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
                                                                                                                                                                                                                                                                                                                                                                                             VGL2_CVMJH STANDARD; PRT; 1235 AA.

Protein SCI. 7:774-781(1998).

-I- EUNCTION: CLEAVES THE GLCNAC-ASN BOND WHICH JOINS OLIGOSACCHARIDES TO THE PEPTIDE OF ASPARAGINE-LINKED GLYCOPROTEINS. REQUIRES THAT THE GLYCOSYLATED ASPARAGINE MOIETY IS NOT SUBSTITUTED ON ITS AMINO (R1) AND CARBOXYL (R2) TERMINUS.

-I- CATALYTIC ACTIVITY: N4-(BETA -N-ACETYL-D-GLUCOSAMINYL)-L-ASPARAGINE + H(2)O - N-ACETYL-BETA-GLUCOSAMINYLAMINE + L-ASPARTATE.

-I- SUBUNIT: HETERODIMER OF AN ALPHA AND A BETA CHAINS.

-I- SUBCELLULAR LOCATION: PERIPLASMIC.

-I- SUBCELLULAR LOCATION: PERIPLASMIC.
